About Exo Works

Healthcare providers have struggled for many years with cumbersome workflow software that contributes to lost revenue, physician burnout and patient reporting errors. In the most time sensitive environments, such as critical care units and emergency rooms, providers require technology that is intuitive, accessible and compatible with hospital's existing systems.

Exo Works is an intuitive ultrasound workflow solution that solves decades-long point-of-care ultrasound workflow issues. It streamlines exam review, documentation, billing and quality assurance and credentialing management in one platform – in seconds. What once took providers several disparate systems to complete can now be done in a fully-integrated system that connects to virtually any point-of-care ultrasound device, EMR or PACS, and works on mobile devices or desktop platforms. Key benefits include:

- Exo Works' unique set of data analytics allows healthcare teams to spend more time with patients, recover funding and increase efficiency among residents and healthcare teams through collaboration.
- Developed with user experience in mind and the understanding that providers do not have extensive windows of time to learn how to operate new software, Exo Works' intuitive design means all users can be confident operating it.
- The software connects to nearly all point-of-care ultrasound devices.
- Exo Works' interface engine securely connects with on-premise systems, including the most common systems used in hospitals to house imaging and communications. The ease of connectivity finally makes interoperability a reality and disconnected ultrasound processes a thing of the past.
- Many emergency and critical care departments have experienced lost exams or exams with inaccurate billing codes, both of which lead to lost revenue for healthcare systems. Exo Works enables providers to easily recover lost exams with a simple search or view their most recent exams, where they can adjust billing codes to ensure images are documented and patients are billed accurately.

● Many hospitals with an ultrasound residency manually track progress of ultrasound scans and hours completed by residents, which makes it hard for educators to keep up with credentialing requirements. Exo Works' exam insights allow both residents and physicians to report and track progress within the platform. These built-in quality assurance and credentialing pathways allow exams to be reviewed instantly by an expert, regardless of their location, due to the software's enhanced security protections designed to keep institutions and patient information safe.
